1. Overview

1.1 Background and Purpose

1.1.1 Acceleronc and ClearOnc

Launched in late 2025 by the Moffitt Cancer Center, AccelerOnc Studio is the first venture studio in the U.S. dedicated exclusively to transforming oncology research and intellectual property into scalable digital health and AI companies. Its primary mission is to take "shelf-bound" clinical breakthroughs and turn them into real-world tools that improve cancer care outcomes globally.

One of AccelerOnc's core platforms is ClearOnc Insights, a technology solution that connects patients and employers directly with Moffitt's world-class oncologists for remote treatment plan reviews. This service allows patients to receive expert, evidence-based guidance and second opinions from anywhere, ensuring their care matches the latest medical standards regardless of their location.

1.1.2 Minlopro Partners

Minlopro Partners is a Salesforce consulting firm that specializes in designing and scaling compassionate, people-centric solutions specifically for the Health and Life Sciences sectors. As a Salesforce Crest Partner with hundreds of certifications, they help healthcare providers, MedTech innovators, and pharmaceutical companies streamline their operations and improve patient outcomes using platforms like Health Cloud. They distinguish themselves through a dedicated team of experts that stays with a client from initial discovery through implementation and ongoing managed services to ensure continuity and deep industry alignment.

1.1.3 Purpose

The purpose of this document is to detail the solution design for the ClearOnc minimal viable product (MVP) implemented on the Salesforce Health Cloud product. This design is derived from client requirements captured in Action Items, Discovery Sessions, and formalized User Stories, and incorporates

internal Minlopro technical direction. This document will serve as the blueprint for configuration and development.

1.2 Goals and Objectives

ClearOnc aims to create a bespoke application using Salesforce Health Cloud and Experience Cloud to facilitate the second opinion process for cancer patients.

The core objectives are:

1. **Efficiency for Physicians:** Achieve a primary business goal to allow Consult Physicians to complete a case review in 30 minutes or less
2. **Single Source of Truth:** Establish Salesforce as the single source of truth for all case-related data and records
3. **Secure Delivery:** Ensure the completed Expert Consult package is securely generated and delivered via a Salesforce Portal, avoiding the transmission of Protected Health Information (PHI) via email
4. **Scalability:** Configure the system to support immediate needs while minimizing technical debt for future phases (e.g., additional clients, modules)

1.3 Scope and Assumptions

The MVP focuses on the core workflow: Case initiation and document upload, summarization via Navya, Care Navigator review and assignment, Physician consult documentation, and final package generation.

Area	Status	Notes
Platform	In Scope	Salesforce Health Cloud and Experience Cloud.
Case Initiation	In Scope	Manual Case Creation by the Client Case Manager (CCM) via the Experience Cloud Portal. Automation is deferred to a future phase due to anticipated low volume

Summarization	Out of Scope	Integration with Navya (summarization tool) via API/Mulesoft is out of scope for MVP. **Work Around:** The Care Navigator (internal Salesforce user) will manually transfer/send/upload raw files to Navya for summarization
Physician UX	In Scope	Consolidated view allowing simultaneous review of data and documentation, utilizing a link to launch Navya
Secure Messaging	In Scope	One-to-one secure messaging between the Care Navigator and Consult Physician or Client Case Manager on the Case page, using a custom built messaging solution (not Chatter)
Package Generation	Out of Scope	Generating a standardized PDF package containing the consult output and physician profile is out of scope for MVP. **Work Around:** The Care Navigator will manually upload the summary from Navya
File Storage	In Scope (MVP)	Raw documents (PDFs, images) will be stored in Salesforce Files for MVP, but long-term external storage (e.g., AWS S3) must be planned due to cost implications
Security/Access	In Scope	A layered system that first controls who can log into the system and then strictly defines what specific data they are allowed to see or edit
Telephony/CTI	In Scope	Integrated call center functionality allows logs incoming calls leveraging Service Cloud Voice powered by Amazon Connect
Patient Experience	Out of Scope	Patient portal access (including managing profiles, requesting opinions, or secure messaging with CN) is OOS for MVP (at least the first year)

		Work Around: Patients will interface with their Case Manager for MVP. The client's Case Manager will work inside of Salesforce
Advanced Automation	Out of Scope	AI-driven provider matching ("Agent Force") and Salesforce IDP (document scraping/parsing) are Out of Scope **Work Around:** Leverage existing Navya tool as interim solution until long-term tool fully vetted and ready for use.

1.4 Key Personas

The solution supports the following defined personas:

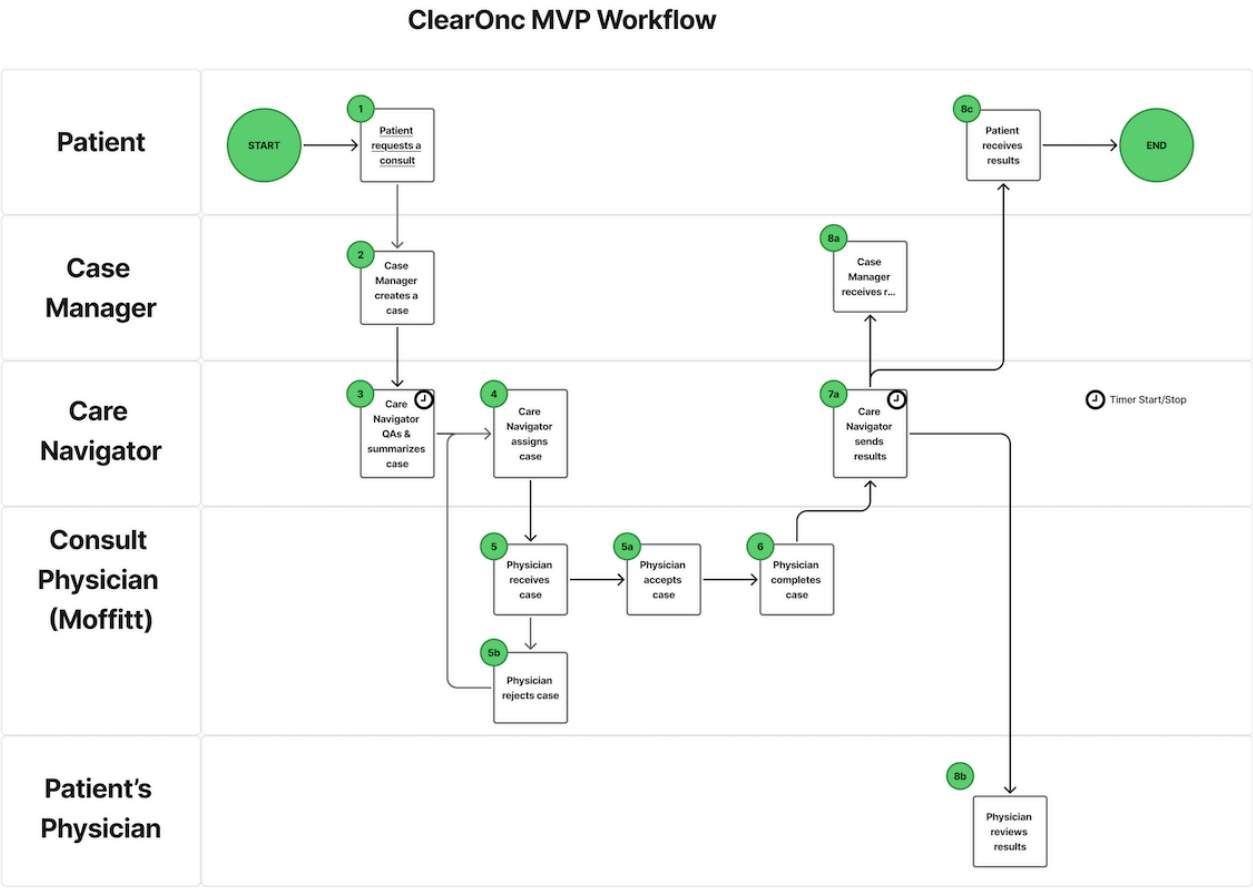
Persona	Role Type	Core Responsibilities
Consult Physician (PH)	External Portal User	Access case data, document second opinions (through Navya), manage assigned workload, secure messaging
Client Case Manager (CCM)	External Portal User	Manually create cases, upload initial documentation, track status, access final consult package. (Client, Payer, and Employer are interchangeable terms for MVP)
Employer	External Portal User	Monitor program health, service ROI, and SLA adherence by accessing masked, aggregated case dashboards and reports, ensuring employee privacy is protected
Care Navigator (CN)	Internal Salesforce User	Assign cases, initiate summarization, approve documentation, monitor SLAs/notifications, review/approve consults, manage package generation, secure messaging with PHI

ClearOnc Admin	Internal Salesforce User	System configuration, data model setup, security (Salesforce Shield)

Other internal users (e.g. Account Executive, Marketing, etc) will have similar access as a Care Navigator but not as a System Administrator.

1.5 Business Process

The following visual represents the high level business process for Consult Intake via Salesforce and related systems.



2. Detailed Solution Design

This implementation includes two types of physicians–a Referring Physician who makes the initial diagnosis and an Expert Consult Physician who will review the information to render a second opinion. Although the Referring Physician's information is captured in Salesforce, only the Consult Physician will have credentials to access case information.

2.1 Provider Experience (Consult Physician)

The consulting provider experience is designed around a requirement of efficiency (under 30 minutes per review).

Requirement	Solution Design
R-1.1: Workload Management	Physicians receive an email notification upon assignment, providing a link to the secure portal. The portal homepage features a "My Open Cases" list view showing Time Remaining
R-1.2: Case Acceptance	Physicians must accept or decline the consult case. The date and time of acceptance or rejection is captured. If a physician does not respond within 24 hours, the case is automatically rejected and sent back to the Care Navigator for reassignment.
R-1.3: Unified View/ Efficient Review	A Custom Lightning Web Component (LWC) was implemented to achieve a side-by-side view. The left side displays patient data and any supporting documents from Navya uploaded by the Care Navigator (Summary, Imaging, Biopsy). The right side allows the Consult Physician to securely message with the Care Navigator
R-1.4: File/Link Interaction	The ideal experience of viewing documents and taking notes simultaneously requires custom effort. For MVP, the native Salesforce file preview is acceptable, even if it overlays the entire screen–as long as scrolling and zooming are possible. Physicians should be instructed to

	right-click links or documents to open them in a new browser tab/window to avoid navigating away from the Case view and losing work
R-1.5: Completing a Submission	Consult physicians will click a button to access the login page for the Navya summarization tool. This link will be input and maintained by the Care Navigator. The physician will coordinate completion with the Care Navigator outside of Salesforce.
R-1.6: Secure Messaging	Physicians can communicate with the Care Navigator assigned to the case through the Secure Messaging feature available on the case page.
R-1.7: Support Requests	Users can submit general inquiries via Support Requests in the menu bar of the Community. **Note:** Communication specific to a case should only be maintained via Secure Messaging.

2.2 Care Navigator (CN) Experience

The Care Navigator manages the case internally within the Salesforce platform (not the portal).

Requirement	Solution Design
R-2.1: Case Management Layout	The CN will use a Case Layout with custom fields and specific record types for second opinion consults, configured within the Care Navigator application. The CN needs to see and edit all fields visible to the provider. The Care Navigator can capture a HIPAA compliant note by clicking on the dropdown arrow next to the Author Notes section on the case page.
R-2.2: Case Assignment / Limits	New Cases are assigned to the Care Navigator queue. Users can find new cases by navigating to the Case tab and searching for the Care Navigator List View (or other relevant list view). Anyone in the queue can edit a case.

	Case assignment is manual for MVP. Users can assign any Care Navigator and Physician. Assigning a physician to the case will automatically advance the case status to 'Assigned'. The CN interface must display physician availability status and current weekly case count. The system will not enforce a hard limit of 2 cases per physician per week for the first 6–12 months
R-2.3: Secure Messaging	A custom secure messaging component is required on the Case page for one-to-one communication with the assigned Consult Physician and Client Case Manager. Messaging will only be available once the Care Navigator and Case Manager or Physician are assigned to the Case. Chatter is disabled/not used for case communications
R-2.4: SLA Tracking & Notifications	SLAs are tracked using visual timers and dashboards. A status bar is available for the Care Navigator to update. Timestamps capture when the case status changes and a physician is assigned. Once the case status changes to Ready for Assignment, a Due Date is set. The due date is 7 business days in the future, including the current date but excluding weekends and federal USA holidays. In-app notifications are used to inform the Care Navigator of important updates.
R-2.5: Package Generation & Delivery	The CN approves/finalizes the consult results manually. After the Care Navigator uploads the final patient summary, an email notifies the Client Case Manager that the document is available. The CN is responsible for managing the case lifecycle from start to finish
R-2.6: File Management	Files can be uploaded manually by accessing the Related tab from most pages. Both the Patient-Friendly Summary and Full Summary can be uploaded directly from the case page. When a file with the Patient Summary category is uploaded to a Document

	Checklist Item, the Client Case Manager will receive an e-mail. To select a different category (or upload multiple of the same category), create a new Document Checklist Item from the case page and select the Document Category. The status of new or existing documents (e.g. those uploaded by a Client Case Manager) can also be updated on the document checklist item page as accepted or rejected.
R-2.7: Support Requests	Community users may submit general inquiries via Support Requests. This will create a case with a Support Request type and can be found in a relevant List View via the Case tab. Care Navigators can then follow-up with the requestor to close the case accordingly. Notifications for new support requests should also be received. Note: Communication specific to a case should only be maintained via Secure Messaging.
R-2.8: Contact Center	Track if calls originate from specific marketing campaigns to measure campaign efficacy and marketing ROI. Internal users can be configured as Service Cloud Voice users to make and receive calls, which will create "Voice Call" records. These records will be associated with a Campaign and have an associated transcript and call recording.

2.3 Client Case Manager Experience

The CCM initiates the process and receives the final output via the secure Experience Cloud portal.

Requirement	Solution Design

R-3.1: Case Submission	The CCM manually creates a new case via a button (e.g. “Create Case”) that launches a custom screen in the Experience Cloud Portal. The system supports documentation upload via drag-and-drop or file selection. Minimal data (e.g., patient name, date of birth) is manually entered for MVP
R-3.2: Initiate Summarization	The CCM must explicitly click a button (e.g., "Submit" or “Initiate") on the Case page to notify the Care Navigator of the uploaded files and structured data. Case Managers can save a consult case as a draft and resume at any point before the final submission.
R-3.3: Status Tracking	The portal displays status updates for submitted cases. Email notifications alert the CCM of key case changes, including when results are available
R-3.4: Final Consult Delivery	The final consult package is accessible via the secure Salesforce Portal. The CCM can optionally download the completed PDF from the case record. PHI packages are never emailed from Salesforce
R-3.5: Secure Messaging	Case Managers can communicate with the Care Navigator assigned to the case through the Secure Messaging feature available on the case page.
R-3.6: Support Requests	Users can submit general inquiries via Support Requests in the menu bar of the Community. Note: communication specific to a case should only be maintained via Secure Messaging.

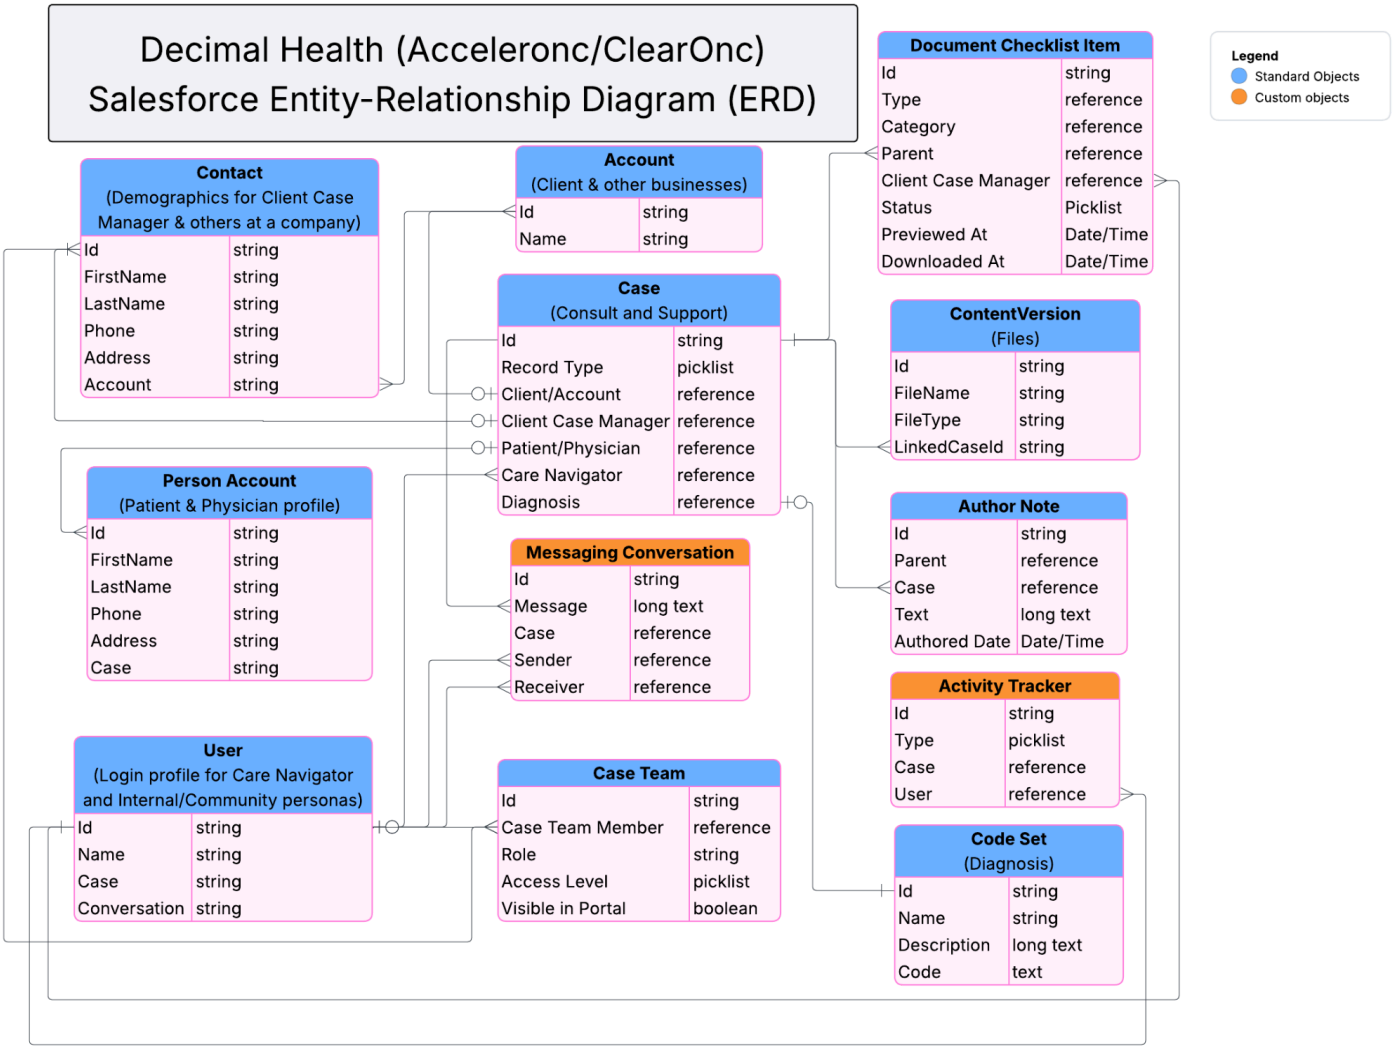
2.4 Employer (Benefits Manager/Leader) Experience

All stories related to the Employer (company) will be deferred to a later phase. The Client Case Manager represents the Employer/Client/Payer/Account for MVP.

3. Data Model and Integration Strategy

3.1 Data Model (Health Cloud Foundation)

The application leverages native Health Cloud objects and relationships. The following depicts a graphical view of the relationship between different objects (or entities) in Salesforce:



- **Case:**
  - Serves as the central core for the second opinion consult request. It stores Core Case Metadata (Patient ID, Cancer Type, Stage,

Source ID) and Case Workflow Context (SLA Timer Start, Case Status, Care Navigator assignment).
    - Also serves as the container for internal support requests
- **Person Account:** Used to track key parties as the sole account
    - **Patient** (not a Salesforce user for MVP)
    - **Provider/Physician** (External / Customer Community User)
        - Physician profile captures Name, Specialty, Credentials (e.g. board certifications, licenses), and Experience Highlights
        - Does not require an associated business account
- **Account (business):** Any organization, business, or company
    - **Client**
    - **Employer**
    - **Payer**
- **Contact:** Anyone associated to a business account except physicians
    - **Client Case Manager** (External / Customer Community User)
- **User**
    - Anyone with access to log into a Salesforce site. Both internal and community users have a User record with a username and password
    - Community users will also have a contact record (including person accounts)
- **Document Checklist Item:**
    - Used to store metadata (attributes) about documents uploaded to Salesforce, such as the patient summary retrieved manually from Navya
    - This is related to the actual file
- **Author Note**
    - A HIPPA compliant method to capture notes
- **Messaging Conversation**
    - Contains the information about messages exchanged between the Care Navigator and Client Case Manager or Physician
- **Code Set**
    - Multi-purpose object to store structured sets of similar data
    - Used to store ICD-10 diagnosis codes for this implementation
- **Case Team**
    - Defines which users have access to a particular Case by role to either view only, edit, or have no access (for historical purposes) to a case

    - Both internal and external users can be defined, as well as contacts
- **Activity Tracker**
    - Maintains a record of events that are not field changes
    - Note: field changes are separately saved as field audit history tracking (up to 60 fields per object with Salesforce Shield)

The Author Note object is only available with certain Salesforce Industries, however, and is in use for this implementation

Note: The objects above do not contain a complete list of all available fields. Refer to Salesforce as fields can be added or changed at any time. Some Health Cloud objects were initially considered but were determined not required to meet the use cases. For future reference, the following is a list of objects that were not utilized but could be considered for future use cases:

- **Health Condition -** tracks a patient's specific medical issues, diagnoses, or health concerns in one centralized place
- **Patient Medical Procedure** - records specific medical actions—such as surgeries, tests, or therapy sessions—that a patient has already received, is currently undergoing, or is scheduled to have in the future
- **Healthcare Provider** - digital profile used to store professional and business-level details about doctors, practitioners, or medical organizations. Provider details are stored directly with the Person Account for MVP
- **Diagnostic Summary** - stores the findings and professional interpretations of a patient's medical tests, such as lab results or imaging reports, in one easy-to-access location
- **Clinical Service Request** - a digital order used to track requests for medical procedures or diagnostic tests that need to be planned or performed as part of a patient's care
- **Care Observation** - a digital log that captures a patient's health data at a specific moment in time, such as vital signs (heart rate, blood pressure), reported symptoms, or biometric measurements from wearable devices
- **Milestone** - time-dependent tracker for required steps (like "First Response" or "Resolution Time") to ensure that support agents meet the service level agreements (SLAs) with customers on time

- **Entitlement** - defines exactly what kind of customer support a person or company is eligible to receive, such as phone support or web assistance, based on their specific service agreement
- **Business License** - represents an official authorization or permit issued by a regulatory agency to an individual or organization, confirming they are legally allowed to operate
- **Board Certification** - tracks a healthcare professional's advanced credentials in a specific medical specialty—such as cardiology or pediatrics—confirming they have met high standards of expertise and training beyond basic licensing
- **Accreditation** - tracks the official quality certifications and professional approvals granted to a healthcare facility or provider by recognized governing bodies
- **Healthcare Provider Specialty** - identifies the specific medical fields—such as cardiology or pediatrics—that a doctor or medical organization is qualified to practice in
- **Person Education -** tracks a healthcare professional's academic history, including the schools they attended, the dates of their studies, and the degrees they earned

3.2 External Integration (Navya & Mulesoft)

For MVP, there is no integration involving the Navya summarization tool nor Mulesoft as middleware. The only connection to Navya is a url field that directs users to the Navya login page (and is manually input by the Care Navigator).

3.3 Security and Compliance

- **Security Implementation:** Salesforce Shield is available for implementation, covering encryption, event monitoring, and field audit history to ensure data integrity and compliance.
- **Data Visibility:** Field-Level Security (FLS) can be used to control access to sensitive fields. For instance, certain metadata like the internal Source System Identifier may be hidden from the Consult Physician.

Salesforce security follows a "least privilege" model where Profiles and Permission Sets define what a user can do (functional access), while Roles, Sharing Rules, and Groups define what records they can see (data visibility).

- **Profile**: Sets the mandatory baseline for a user, including essential system settings like login hours and IP ranges. Unlike other features, a user can have only one profile.
- **Permission Set:** Used to grant additional functional permissions (like object or field access) to specific users without changing their base profile. It is the recommended way to scale access because a user can have multiple permission sets.
- **Permission Set Group**: Bundles multiple permission sets into a single unit for easier assignment based on a job function. It includes a unique "muting" feature to strip away specific permissions from the group without modifying the original sets.
- **Queue**: A holding area for records (like Leads or Cases) that do not yet have an individual owner. It differentiates from other groups by allowing members to claim ownership of those records to manage workloads.
- **Public Group**: An administrative collection of users, roles, or other groups used primarily to simplify sharing. Unlike a Queue, it is used for visibility and collaboration rather than record ownership.
- **Role** (via Role Hierarchy): Automatically grants managers access to the records owned by their subordinates in an organizational tree. It is a vertical sharing mechanism designed to reflect a company's reporting structure.
- **Sharing Rule**: Sets exceptions to organization-wide defaults to grant record access to specific groups or roles. It is used for lateral sharing when the Role Hierarchy does not naturally provide the necessary access.

The following security and visibility elements are relevant for this implementation:

- Profiles
    - ClearOnc Internal User
    - Client Case Manager Plus
    - Physician Plus
- Permission Set Groups
    - Care Navigator
    - Client Case Manager

    - Physician
    - Super User Permission Set Group
- Permission Sets
    - Contact Center Admin
    - Contact Center Agent
- Queues
    - Care Navigator Queue
    - Support Queue
    - SCV Basic Queue
    - Secure Messaging Fallback Queue
- Public Groups
    - Care Navigator Group
    - Support
- Role Hierarchy
    - System Admin
        - Care Navigator
- Sharing Rule
    - Case.Support Requests

Note: The security model is subject to change at any time.

4. Technical Architecture and Decisions

This section formalizes the technical approaches based on internal Minlopro discussions.

4.1 Custom Implementation

Component	Technical Approach	Rationale
Side-by-Side View	**Lightning Web**	The custom LWC is mandatory to create two independently navigable sections within a single screen, preventing the entire page from

	Component (LWC)	redirecting when a link is clicked on the left pane. This aligns with the client's priority of excellent user experience and meeting the <30 minute goal
Create Case	**Lightning Web Component (LWC)**	A custom LWC was created to manage the experience and validate required information is collected before submission
Secure Messaging	**Lightning Web Component (LWC)**	A custom LWC component was created to ensure private, one-to-one communication solely between the assigned Care Navigator and Physician or Client Case Manager
<Various Functions>	**Flows**	Several Flow Definitions were created to manage the different processes. As of January 20, 2026, the following is a list of the existing Flows.

Flow Label ↑	Flow Description	Process Type	Trigger	Triggering Object or Platform Event Label	API Version
DH - PE - File Event - Update Fields on Document Checklist Item		Autolaunched Flow	Platform Event	File Event	65
DH - RTF - Account - Update Birthdate Text	This flow is used to populate birthdate text field	Autolaunched Flow	Record—Run Before Save	Account	65
DH - RTF - Account - Update Physician Details on Cases	-Changes for Record Type	Autolaunched Flow	Record—Run After Save	Account	65
DH - RTF - Case - Physician Change	-Changes for Record Type - Changes for support cases email - Changes for administrative email	Autolaunched Flow	Record—Run After Save	Case	65
DH - RTF - Case - Set Due Date Field	-Changes for Record Type	Autolaunched Flow	Record—Run After Save	Case	65
DH - RTF - Case - Set Due Days Fields	-Changes for Record Type	Autolaunched Flow	Schedule	Case	65
DH - RTF - Case - Update Case On Physician Change	- Changes for Assigning owner, Account and Client for Support Cases - Changes for Record Type	Autolaunched Flow	Record—Run Before Save	Case	65
DH - RTF - Document Checklist Item - Send email on document received	-Changes for Record Type	Autolaunched Flow	Record—Run After Save	Document Checklist Item	65
DH - Update Case Count Schedule Flow		Autolaunched Flow	Schedule	Account	65
DH | Omni Channel | Inbound Voice Call Flow	Routes each call to the default queue (Basic Queue) and, if the agent accepts, screen pops the new case for this call and identifies the caller.	Omni-Channel Flow			56
DH | User | Record Triggered | Before Flow		Autolaunched Flow	Record—Run Before Save	User	65
DH | Voice Call | Record Triggered | After Flow		Autolaunched Flow	Record—Run After Save	Voice Call	56
Navya Redirection Flow		Screen Flow			66
Set Due Days Field Flow		Autolaunched Flow			65
Update Case Count	-Changes for Record Type	Autolaunched Flow			65

Important: Technical aspects can change any time. A System Administrator can access a complete list of Flows and Components (both LWC and Aura) by navigating to Setup and searching for “Flows” or “Lightning Components” respectively.

4.2 Document Generation

For MVP, Salesforce will not generate any PDF documents. The Care Navigator will manually upload any documents for other users to access.

4.3 Out-of-the-Box Functionality Leverage

- **File Preview:** Despite the preference for a non-full-screen view, the native Salesforce file preview (full-screen overlay allowing scroll/zoom) is deemed acceptable for MVP to manage cost/effort.
- **List Views/Navigation:** Standard Salesforce list views (e.g., "My Open Cases," "My Closed Cases") will be used for physician workload management and navigation.
- **Notifications:** Standard email notifications will be utilized for initial case assignment and reminders. In-app (custom) notifications will be used to alert CNs of messages or approaching SLAs.

5. Key Metrics and Analytics

Reports and dashboards can be implemented at any time to track system usage, performance, and compliance metrics, relying on data captured in Salesforce. Examples of potential metrics are:

Metric Category	Key Metrics/Data Points to Capture	User Persona
SLA Compliance	Case Status, Time Remaining to Complete (5-day SLA), Time elapsed per stage (submission, assignment, consult rendering), SLA adherence trends	CN, ClearOnc Leader
Physician Capacity	Current weekly case count, Physician Availability Status (Active/Away), Time spent per consult (business goal)	CN, ClearOnc Leader
Case Outcome	Case Outcome (e.g., Affirmed/Other Recommended Diagnosis), Case Ages, Case Outcome Reports	ClearOnc Leader, Employer
Activity Tracking	Case-specific communications (Secure Messaging Audit Log), Email interactions, Key stakeholder contact interactions	AE, CN, Admin

Call Center Metrics (Future)	Average Handle Time, Dropped Calls, Call Sentiment Analysis (Future/OOS for MVP Telephony)	Call Center Manager

6. Administrative Functions

6.1 Activating a Community User

Every Community User must either be a Person Account or live under a Contact (and that Contact must be associated with an Account). For this implementation, the following personas are initially setup as community users:

Persona	Object
Consult Physician	Person Account
Client Case Manager	Contact (with Account)

Before enabling a community user, first create a Person Account or Contact.

To create a Contact:

1. Create or Open an Account: Go to the Accounts tab and ensure the business account you want to use exists or create one.
2. Create or Open a Contact: Under that Account, create a new Contact record with the person's name and a valid email address or open an existing contact.

To create a Person Account, go to the Accounts tab and create a new physician **person** account or open an existing physician account. Enter all information about the physician, including credentials.

For both the contact and person account, check the account ownership to ensure the Account Owner (the internal Salesforce user) has a Role assigned to them in their User record. Salesforce requires the owner of a portal account to have a role to prevent security errors.

Enable the Contact or Person Account as a Customer User

Once the Contact or Person Account is ready, you can "promote" them to a user.

1. Navigate to the record you just created.
2. In the top-right action menu (buttons), click Enable Customer User.
    - Note: If you don't see this button, your admin may need to add it to the Page Layout.
3. You will be redirected to the New User screen. Most fields will auto-populate from the Contact record.
4. Configure the License and Profile:
    - User License: Select Customer Community ***Plus***.
        i. Important: if you do not see this option, it's because all licenses are in use.
        ii. Either deactivate a user to repurpose the license or purchase more licenses from Salesforce
    - Profile: Select the Client Case Manager *Plus* or Physician *Plus* profile
5. Input other fields as necessary, including the following considerations:
    - The username must be unique across **all** Salesforce environments (not just ClearOnc). It's typically the person's e-mail address.
    - However, if the same e-mail is utilized as a username with multiple Salesforce instances, then you may need to append the username with something like **.**ClearOnc to make it unique (e.g. johndoe@moffitt.org.clearonc)
    - The nickname is what's displayed in the Community to other users.
6. Notify and Save: Check the box "Generate new password and notify user immediately" so they receive an automated email to set their password, then click Save.
    - *Important*: This is usually checked by default. As such, if you're setting up users *in advance* but don't yet want them to log in, be sure to **un**check the box. When you're ready for them to log in, you can return to the user's profile to edit the page and recheck the box.
    - This checkbox applies to both internal and external users.

    - For future troubleshooting, you may also use this method to reset a user's password. (Note: This operates differently from the "Reset Password" button but is the best approach)
7. Save the record.
8. **After** saving the record, confirm you are viewing the new user's page or navigate to it.
9. Add the Permission Set Group
    - If creating a Client Case Manager, grant the 'Client Case Manager' permission set *group*.
    - If creating a Physician, grant the 'Physician' permission set *group*.

Impersonate a Customer User

After the Customer User has been enabled, you can view the community as the user.

1. Navigate to the record you just created.
2. In the top-right action menu (buttons), click "Log in to Experience as User"
    - Note: If you don't see this button, your admin may need to add it to the Page Layout.
3. You will be redirected to the community where you navigate just as the portal user does.

License Types

Salesforce licenses act as the primary gatekeeper for a user's baseline functionality and record access. They are generally categorized into internal licenses for employees and external licenses for customers.

- Salesforce (Internal): This is the "Full CRM" license designed for employees. It provides unrestricted access to standard CRM objects, as well as the ability to use complex administrative tools. All internal users (including Care Navigators) use this license.
- Customer Community (External): Designed for high-volume B2C scenarios where customers need basic self-service. It provides access to Knowledge and Case objects but uses a simplified "Sharing Set" security model rather than standard Salesforce roles and sharing rules; it is **not** suitable for Case Teams .
- Customer Community *Plus* (External): A more advanced external license for B2B or complex B2C scenarios. It allows external users to

access the standard Salesforce security model (including roles and sharing rules) and provides access to advanced features like Reports and Dashboards. This is the minimum requirement for external users to participate in Case Teams, which is why it's used for the MVP implementation. Both Client Case Managers and Consult Physicians use this license.

6.2 Activating an Internal User

Internal Salesforce Users (assigned the "Salesforce" user license) are employees who require full access to standard CRM features—as well as the ability to use any standard or custom applications in your organization. This is the most comprehensive internal license.

Steps to Create a User

Creating a user can be done quickly by following these steps:

1. *Navigate to Users*: From Setup, type "Users" in the Quick Find box and select Users.
2. *Add New User*: Click New User (to add one) or Add Multiple Users (to add up to 10 at once).
3. *Enter General Information*: Fill in the Name, Email, and Username (which must be unique across all Salesforce orgs and formatted like an email address).
4. *Assign Access*: Select 'Salesforce' as the User License, then choose the "ClearOnc Internal User" Profile and Role (if applicable) for the user.
5. Refer to the note above about completing the user setup and sending the user's password in the Community Users section.
6. Add the Permission Set Group
    a. If creating a Care Navigator, grant the 'Care Navigator' permission set *group*.
    b. If the user requires elevated permissions (more than a standard user), grant the 'Super User Permission Set Group' permission set *group*.

Impersonate an Internal User

System Administrators can impersonate (log in as) another user to troubleshoot issues or verify access levels.

1. From Setup, type Users in the Quick Find box and select Users.

2. Locate the specific user you wish to impersonate.
3. Click the Login link next to their name.
    - Note: A banner will appear at the top of the screen to indicate you are now viewing Salesforce from that user's perspective.

Note: This feature must first be enabled at the organizational level before the "Login" button appears on individual user records. To do so, navigate to Setup→Login Access Policies and check the box for "Administrators Can Log in as Any User".

6.3 Diagnosis Codes

ICD-10 Diagnosis Codes are represented by Code Sets. They were originally loaded from rows C000 - D099 of the Valid ICD-10 List (XLSX) file at CMS.gov but can be changed at any time. To do so, navigate to "Code Sets" from the App Launcher and create a new record or edit an existing record. The name and code are required at minimum but other fields are helpful. Follow existing records as a guide.

6.4 Document Checklist Item Categories

The Document Category field for the Document Checklist Item object is a record (not a field) but cannot be edited via Object Manager. To modify the options, go to Setup→Document Category.

Note: The Document Type was not initially used for this implementation but can be leveraged in the future. The Document Category is a higher-level grouping used to organize checklist items into logical sets, whereas the Document Type represents the specific nature of a file required for a process. The Document Type identifies what the document actually is and is often used for automated mapping and reporting.

- Examples of Document *Types*: Paystubs, Passport Copy, Patient Referral.
- Examples of Document *Categories*: Identity Proof (which might include Passport and Driver's License), Address Proof, or Income Verification.

If future updates utilize both, be sure to also create Document Category Document Types in Setup.

6.5 Contact Center (Service Cloud Voice)

Service Cloud Voice is an intelligent tool that puts your company's phone system directly inside Salesforce, allowing agents to answer calls and view customer history on a single screen. It uses AI to transcribe conversations in real-time, instantly suggesting helpful solutions so agents can focus on the customer instead of taking notes.

To enable a user for Service Cloud Voice:

1. **Assign Feature Licenses:** Edit the user's record and check the Service Cloud User box. Ensure they are also assigned a Service Cloud Voice add-on license through your available license pool.
2. **Assign Permission Sets:** Provide the user with the appropriate standard permission sets based on their role:
    a. Contact Center Agent: Grants access to receive and manage calls.
    b. Contact Center Admin: Required for those who will configure the contact center settings.

6.6 Other Functions

There are many other capabilities and features available to a System Administrator. To learn more, detailed guides are available at trailhead.salesforce.com and elsewhere online.
